### Description

The 2.43 monoclonal antibody reacts with mouse CD8 $\alpha$ . The CD8 antigen is a transmembrane glycoprotein that acts as a co-receptor for the T cell receptor (TCR). Like the TCR, CD8 binds to class I MHC molecules displayed by antigen presenting cells (APC). CD8 is primarily expressed on the surface of cytotoxic T cells, but can also be found on thymocytes, natural killer cells, and some dendritic cell subsets. CD8 most commonly exists as a heterodimer composed of one CD8 $\alpha$  and one CD8 $\beta$  chain however, it can also exist as a homodimer composed of two CD8 $\alpha$  chains. Both the CD8 $\alpha$  and CD8 $\beta$  chains share significant homology to immunoglobulin variable light chains. The molecular weight of each CD8 chain is

approximately 34 kDa. The 2.43 antibody exhibits depleting activity when used in vivo.

## Storage

Store at the stock concentration at 4°C. **Do not freeze.**

It is not uncommon for a floccule or precipitate to appear during storage. The floccule is typically buffer salts precipitating out of solution or a small bit of protein aggregation. For information on how to remove floccules or precipitates see our FAQ's at <https://bioxcell.com/faqs>.

## Protocol Information

Since applications vary, each investigator should use the application references as a guide to help estimate the appropriate dose or concentration. The dose or concentration can be further optimized experimentally in a dose response or titration experiment.
