Technical Data Sheet

Recombinant salmon FGF-2 (154 aa) protein

bioxcell.com

Attention: Use of this product constitutes an agreement to Bio X Cell's Terms and Conditions which are included with this product in print and can also be found at https://bioxcell.com/terms-and-conditions.

Lot Specific Information

Lot Number: **Lot Specific***

Total Protein: **Lot Specific***

*This information will be noted on the certificate of analysis that ships with this product.

Shelf Life

This product has a guaranteed shelf-life of one year from the date of customer receipt when stored as recommended.

Product Information

Catalog Number:	**RP094**
Protein Identity:	Confirmed identity with expected mass, determined by mass spectrometry
Reported Applications:	Expansion of salmon pluripotent, embryonic and mesenchymal stem cells Cellular agriculture and cultivated meat cell culture media optimization Serum-free media development Cellular proliferation, migration and survival
Formulation:	Lyophilized, white powder
Endotoxin:	≤0.8 EU/mg, LAL assay
Purity:	≥95%; SDS-PAGE
Reconstitution:	Resuspend in sterile-filtered water at >50 µg/ml. Once reconstituted, store in single-use aliquots to avoid freeze-thaw cycles. Store reconstituted protein at -20 °C to -80 °C for a maximum of 12 months or until the expiry date if sooner.
Sterility:	Sterile
Production:	Microbial. Expressed in E. coli
Molecular Weight:	17 kDa (monomer)
Bioactivity Assay:	No significant difference between EC50 of reference and test lots
Mycoplasma:	Negative

Description

Recombinant salmon FGF-2 (154 aa) protein, also known as basic fibroblast growth factor (bFGF), is a key member of the fibroblast growth factor family, a 154-amino-acid protein of around 17 kDa that exists in multiple isoforms and adopts a β-trefoil fold stabilized by disulfide bonds essential for biological activity. FGF-2 plays pivotal roles in cell growth, differentiation and angiogenesis and is a significant growth factor in embryonic development, tissue repair and wound healing. In stem cell research, FGF-2 is a key component of culture media that maintains the pluripotency and self-renewal of embryonic stem cells (ESCs) and induced pluripotent stem cells (iPSCs), activating signaling pathways including the MAPK pathway to sustain expression of the pluripotency genes Oct4, Sox2 and Nanog, preventing differentiation and allowing expansion in vitro. FGF-2 can also be incorporated into scaffolds or hydrogels with stem cells to promote proliferation and differentiation in a three-dimensional environment, which holds great promise for cultivated salmon protocols, making salmon FGF-2 a key reagent for serum-free media development in the cellular agriculture industry. This protein is optimized for in vivo and functional applications: low-endotoxin, tag-free, and carrier-free, supporting reproducible performance in demanding preclinical and bioactivity studies. Species reactivity: salmon.

Storage

Store at the stock concentration at 4°C . **Do not freeze.**
It is not uncommon for a floccule or precipitate to appear during storage. The floccule is typically buffer salts precipitating out of solution or a small bit of protein aggregation. For information on how to remove floccules or precipitates see our FAQ's at https://bioxcell.com/faqs.

Store lyophilized protein between -20 °C and -80 °C until the date of expiry. Avoid freeze-thaw cycles
